Predict demo — US markets (English)

Other demos: Germany (Deutsch) · China (中文) · Design and threat model: ../prediction-market.md

Three example markets for a US audience, showing the three market shapes the

Predict tab supports:

1. a **binary** market with a 2-of-3 resolver committee,
2. a **multi-outcome** market (2–16 outcomes) with a committee,
3. a **staked-oracle** market where anyone can propose the result.

Each has the exact create-form values, a written resolution rule, and the

lifecycle from creation to redemption.

> **Testnet demo, not a real-money product.** The collateral is native BIG (`bc`) on the prediction test chain. In the US, real-money event contracts are regulated by the CFTC (a designated contract market is required), and sports or election contracts also run into state gaming law. Nothing here is an offer to US persons; see §8 of the design.

Before you start

- **A PQ (ML-DSA) wallet.** Prediction actions reject EC wallets.
- **BIG on the prediction chain.** BIG pays the fees and is the collateral. There is no bridge/peg-in screen in the app yet, so an operator funds demo wallets on the prediction chain.
- **Market creation is permissioned.** The creator's key must be authorized to sign the prediction chain's token domain. Trading, resolving, disputing, voting and redeeming are open to any funded PQ wallet.
- **Committee addresses.** For committee markets, collect the hex addresses of the resolvers (each resolver's wallet address). With 3 resolvers a result needs **2 matching resolutions** (a majority, `size/2 + 1`).
- **Units.** Supply, bonds and order-book prices are **raw on-chain units**. One winning share redeems exactly one unit of collateral, so a price relative to one collateral unit reads as the market's implied probability. The app does not convert to ¢ or %.
- **Day counts below assume creation on 2026-10-23.** "Resolution days" accepts fractions; recompute for your own date.

Market 1 — Fed decision (binary, committee)

Question: *Will the FOMC lower the federal funds target range at its

first scheduled meeting of 2027?*

Create-form field	Value
Question	`Will the FOMC lower the federal funds target range at its first scheduled meeting of 2027?`
Outcomes	`YES` / `NO` (one per line)
Collateral	`bc`
Supply	`1000000`
Resolution days	`105` (→ 2027-02-05, after the meeting statement)
Dispute window (s)	`86400` (24 h)
Auto-invalid (s)	`2592000` (30 days)
Oracle	`committee`
Committee	3 resolver addresses, one per line
Bond (dispute bond)	`1000`

Resolution rule. The market resolves to **YES** if the FOMC statement issued after the first scheduled 2027 meeting (federalreserve.gov) lowers the upper bound of the target range; it resolves to **NO** if the range is unchanged or raised. An unscheduled (emergency) cut before that meeting does not count. If no scheduled meeting is held before the resolution time, resolvers post **INVALID**.

Market 2 — December 2026 CPI (multi-outcome, committee)

Question: *What will the BLS report as US CPI-U year-over-year inflation for December 2026 (not seasonally adjusted, first release)?*

Create-form field	Value
Outcomes	`Below 2.5%` / `2.5% to 3.0%` / `Above 3.0%`
Collateral / Supply	`bc` / `1000000`
Resolution days	`94` (→ 2027-01-25, after the January CPI release)
Dispute window / Auto-invalid (s)	`86400` / `2592000`

Oracle / Committee / Bond	`committee` / 3 addresses / `1000`

Resolution rule. Use the first BLS release, rounded to one decimal as published. `2.5% to 3.0%` includes both bounds (2.5 and 3.0). Later revisions are ignored. If BLS does not publish by the resolution time (for example during a federal shutdown), resolvers wait; if nothing is resolved before the auto-invalid deadline, the market voids.

Outcome labels may not contain commas, must be unique, and are limited to 40 characters. A split of C collateral yields C shares of **every** outcome.

Market 3 — S&P 500 year-end close (binary, staked oracle)

Question: *Will the S&P 500 index close above 7000 on December 31, 2026?*

Create-form field	Value
Outcomes	`YES` / `NO`
Collateral / Supply	`bc` / `1000000`
Resolution days	`71` (→ 2027-01-02)
Dispute window (s)	`86400`
Auto-invalid (s)	`1209600` (14 days)
Oracle	`staked` (leave Committee empty)
Bond (proposal bond)	`5000`
Vote window (s)	`172800` (48 h)

Resolution rule. The official S&P Dow Jones Indices closing value for the last trading session of 2026. **YES** if strictly above 7000.

Walkthrough (same for all three markets)

1. **Create.** Predict tab → **Create market** → fill the table → submit. The app mints one fixed-supply token per outcome, creates the contract token, and moves the full supply into the market's vault. The market appears as **OPEN**.
2. **Provide liquidity (split).** Enter an amount and press **Split**: C BIG becomes C shares of every outcome. **Merge** does the reverse while the market is open.
3. **Trade.** Each outcome has an order book against BIG (best bid/ask and size). **Buy**/**Sell** opens a preview with the estimated fill, a limit price and slippage (0–10%, default 0.5%). A quote expires after 30 s and the book is

re-read when you submit. These are crossing limit orders, so any unfilled remainder rests on the book.

4. **Resolve.** After the resolution time the market shows *resolution due*.
5. *Committee (markets 1–2):* each resolver presses the outcome. When a majority agrees, the market becomes **PENDING** and the dispute window starts.
6. *Staked (market 3):* anyone proposes an outcome and bonds at least the proposal bond. The market becomes **PENDING**.
7. **Dispute.** While **PENDING**, anyone can post a different outcome with a bond.
8. *Committee:* the bond (≥ dispute bond) is paid to the resolvers, the resolutions are cleared, and the committee resolves again.
9. *Staked:* a challenger (not the proposer) bonds at least the proposal bond. The market becomes **VOTING**, and holders bond BIG on either side for the vote window. The side with more bonded weight wins; winners get their stake back plus a share of the losing bond. A tie voids the market.
10. **Final.** When the window passes with no dispute, the market is **FINAL**. If nobody resolves before *resolution time* + *auto-invalid*, it finalizes as **INVALID**.
11. **Redeem.** In a **FINAL** market, **Redeem** burns winning shares 1:1 for BIG. In an **INVALID** market it burns complete sets (one share of every outcome) for 1 BIG each; unmatched leftover shares stay in the wallet.

The list filters **open / resolving / final / mine** and the search box find a

market again later. *Mine* shows the markets where you hold shares.

Checklist for writing your own US market

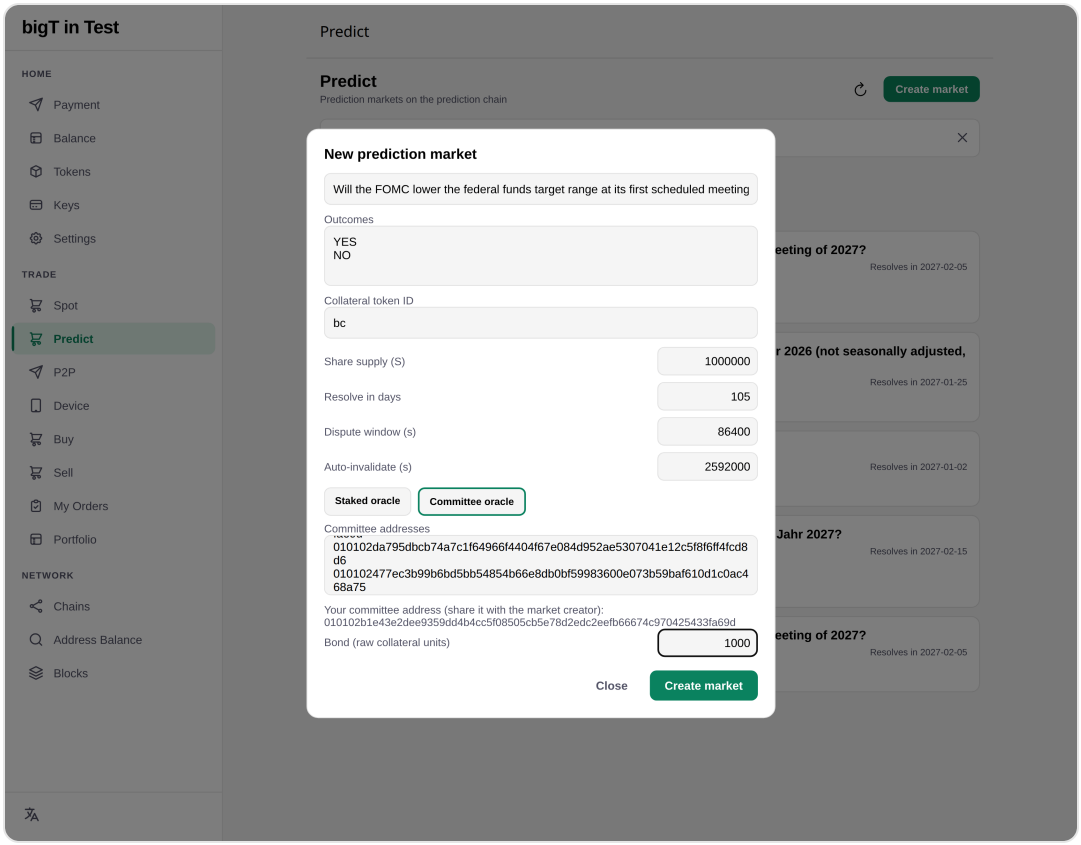

- Name **one primary source** and the exact figure: release, series, seasonal adjustment, first print or revised.
- Define the boundaries. Which side owns an exact tie (for example "2.5% to 3.0% includes both bounds")?
- Say what happens if the source is late or missing: wait until auto-invalid, or resolve INVALID.
- Set the resolution time **after** the source publishes, and give the dispute window enough time for a human to check.
